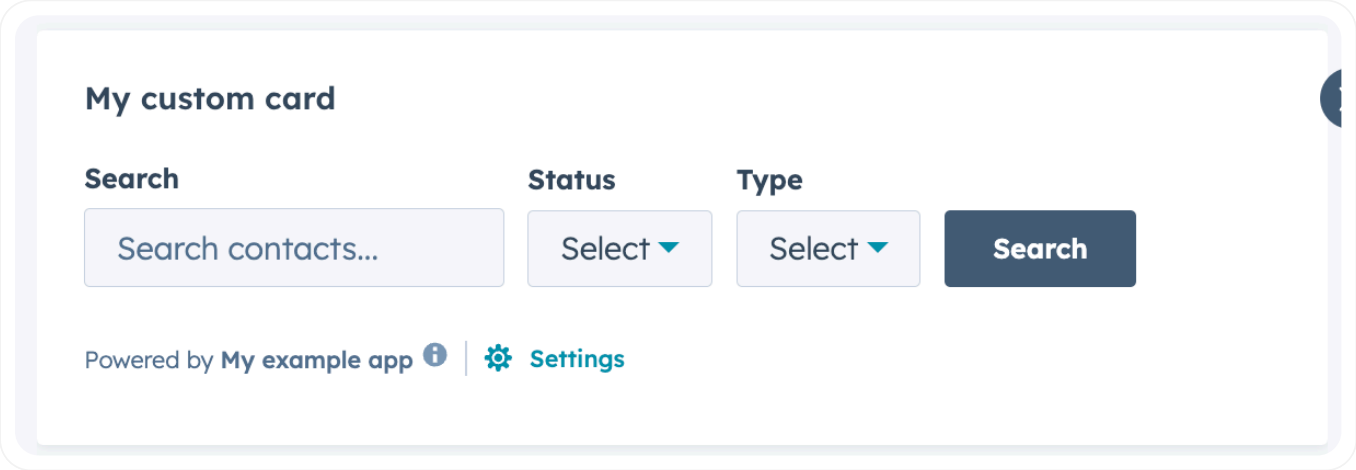
Standard components

Inline | UI components

Learn about the Inline component for UI extension layout management.

The `Inline` component uses flexbox styling to organize child components in a horizontal row. Similar to `Flex` and `Box`, use `Inline` to **manage the layout** of a UI extension.



HubSpot Developers

```
function Extension() {
  return (
    <>
      <Inline gap="small" align="end" justify="start">
        <Input label="Search" placeholder="Search contacts..." name="search" />
        <Select
          label="Status"
          options={[
            { label: "All", value: "all" },
            { label: "Active", value: "active" },
            { label: "Inactive", value: "inactive" },
          ]}
          name="status"
        />
        <Select
          label="Type"
          options={[
            { label: "All Types", value: "all" },
            { label: "Leads", value: "leads" },
            { label: "Customers", value: "customers" },
          ]}
          name="type"
        />
        <Button variant="primary">Search</Button>
      </Inline>
    </>
  );
}
```

Props

Prop	Type	Description
`align`	`'start'` | `'center'` | `'end'` | `'baseline'` | `'stretch'` (default)	Distributes components along the cross-axis using the available free space.

HubSpot Developers

`justify`	`'start'` (default) | `'center'` | `'end'` | `'around'` | `'between'`	Distributes components along the main axis using the available free space.
