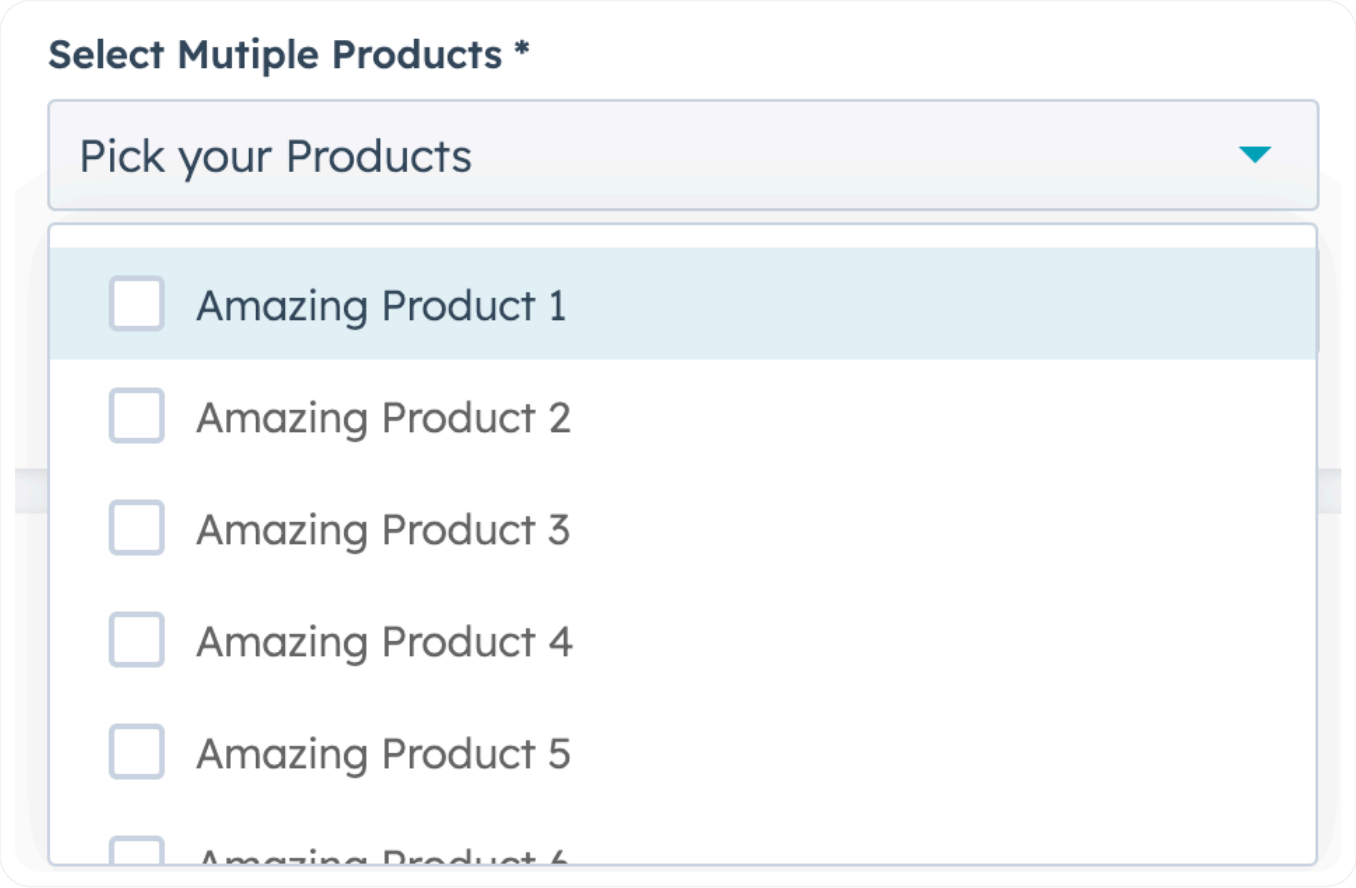
Standard components

MultiSelect

Learn about the MultiSelect component for use in UI extensions.

The `MultiSelect` component renders a dropdown menu select field where a user can select multiple values. Commonly used within the **Form** component.



HubSpot Developers

```
  return (
    <Form preventDefault={true} onSubmit={() => console.log(formValue, "hola")}
      <MultiSelect
        value={formValue}
        placeholder="Pick your Products"
        label="Select Multiple Products"
        name="selectProduct"
        required={true}
        onChange={value => setFormValue(value)}
        options={[
          { label: "Amazing Product 1", value: "p1" },
          { label: "Amazing Product 2", value: "p2" },
          { label: "Amazing Product 3", value: "p3" },
          { label: "Amazing Product 4", value: "p4" },
          { label: "Amazing Product 5", value: "p5" },
          { label: "Amazing Product 6", value: "p6" },
        ]}
      />
      <Button type="submit">Submit</Button>
    </Form>
  );
}
```

Props

Prop	Type	Description
`description`	String	Text that describes the field's purpose.
`error`	Boolean	When set to `true`, `validationMessage` is displayed as an error message if provided. The input will also render its error state to let the user know there's an error. If left `false` (default), `validationMessage` is displayed as a success message.
`label`	String	The text that displays above the dropdown menu.
`name`	String	The input's unique identifier.

HubSpot Developers

		`label` will be used as the display text, and `value` should be the option's unique identifier, which is submitted with the form.
`readOnly`	Boolean	When set to `true`, users will not be able to enter a value into the field. Set to `false` by default.
`required`	Boolean	When set to `true`, displays a required field indicator.
`tooltip`	String	The text that displays in a tooltip next to the label.
`validationMessage`	String	The text to display if the input has an error.
`value`	String | number	The value of the input.
