UI Components

UI extension components

Learn about the components that you can use to build UI extensions.

When building a UI extension, you can include any number of HubSpot-provided reusable components. These components range from simple text fields to out-of-the-box CRM object reports, and each component offers customization options through properties.

> **Please note:**
>
> To access the latest components, ensure that you've installed the latest npm package by running `npm i @hubspot/ui-extensions` in the `cards`, `settings`, and/or `pages` directory.

Components are imported at the top of your `tsx` or `jsx` extension file. Depending on the type of component, you'll need to import them from one of two SDK directories.

- **Standard components** are imported from `'@hubspot/ui-extensions'`
- **CRM data** and **CRM action components** are imported from `'@hubspot/ui-extensions/crm'`

```
import { Alert, Text } from "@hubspot/ui-extensions";
import { CrmAssociationPivot, CrmActionLink } from "@hubspot/ui-extensions/crm"
```

> For a visual library of these UI components, check out HubSpot's .

Standard components

Standard components are components that can be used for both internal and external data. These components do not fetch data on their own, but are more flexible in their

HubSpot Developers

Component	Description
Accordion	A collapsible accordion section that can contain other components.
Alert	Alerts for indicating statuses and action outcomes, such as success and error messages.
AutoGrid	A layout component for arranging components into columns based on available space and specified column width restraints.
BarChart	A bar chart used for visualizing categorical data.
Box	A layout component used with **Flex**. Learn more about **managing extension layout**.
Button	Buttons that enable users to perform actions, such as sending or retrieving data.
ButtonRow	For rendering multiple buttons.
Checkbox	A single checkbox input. To display multiple checkboxes, use **ToggleGroup** instead.
CurrencyInput	An input field with currency formatting, symbols, and locale-specific display patterns.
DateInput	A field that enables users to select a date.
DescriptionList	Displays pairs of custom labels and values, similar to how HubSpot properties appear in the left sidebar of CRM records.
Divider	A horizontal line for separating components within an extension.
Dropdown	A dropdown menu for selecting values, styled as either buttons or hyperlinks.
EmptyState	A labeled illustration to indicate a component without content.
ErrorState	Labeled illustrations to indicate errors.
Flex	A layout component that wraps components in a `div` set to `display=flex`. Use this component

HubSpot Developers

	and **Button**.
Heading	Renders large text for titles.
Icon	Renders a visual icon within other components.
Illustration	Renders an image from HubSpot's illustration library.
Image	An image, primarily used for adding logos or other visual brand identity assets, or to accentuate other extension content.
Inline	A layout component to arrange components in a horizontal row.
Input	A text input field where users can enter custom text values. Primarily used within **Form** components.
LineChart	A line chart used for visualizing time series plots or trend data.
Link	A clickable hyperlink for navigating to external and HubSpot app pages, or for triggering functions.
List	An ordered or unordered list of items.
LoadingButton	Similar to a **Button** component with additional loading state options.
LoadingSpinner	A visual indicator that the card is loading or processing.
Modal	A pop-up overlay containing other components. Useful for short messages and action confirmation boxes. Can be opened with **Button**, **LoadingButton**, **Link**, **Tag**, and **Image** components.
MultiSelect	A dropdown select field where users can select multiple values. To allow only one value to be selected, use **Select** instead. Primarily used within **Form** components.
NumberInput	A number input field. Primarily used within **Form** components.

HubSpot Developers

ProgressBar	A visual representation of data in motion toward a positive or negative target. Can display both numbers and percentages.
RadioButton	A radio select button. If you want to include more than two radio buttons, or are building a **Form**, it's recommended to use **ToggleGroup** instead.
ScoreCircle	Visualize performance metrics, completion percentages, or quality scores with color-coded circles.
SearchInput	An input field that enables users to search, including props for validation.
Select	A dropdown select field where a user can select a single value. To allow selecting multiple values, use **MultiSelect** instead.
Spacer	A layout component that adds vertical spacing between components.
Statistics	A visual spotlight of one or more data points. Includes numeric values and trend indicators (increasing/decreasing percentage).
StatusTag	A visual indicator to display the current status of an item.
StepIndicator	A visual indicator to describe the progress within a multi-step process.
StepperInput	Similar to the **NumberInput** component, but this field enables users to increase or decrease the value by a set amount.
Tabs	Renders a tabbed container with options for visual styling, tooltips, and more.
Table	Displays data in columns and rows. Tables can be paginated and sortable.
Tag	Colored labels for categorizing information or other components. Can be static or clickable for triggering functions.

HubSpot Developers

TextArea	Similar to Text, but for longer sets of text. Includes props for configuring field size, maximum characters, and resizeability.
Toggle	A boolean toggle switch that can be configured with sizing and label options.
ToggleGroup	A list of selectable checkboxes or radio buttons.
Tooltip	A tooltip overlay that appears when hovering over the parent element. Supported in Button, Image, Link, LoadingButton, and Tag components.

CRM data components

CRM data components can pull data directly from the currently displaying CRM record, including information about associated records and single object reports. These components can only be placed in the middle column of CRM records. Learn more about CRM data components.These components are imported from `@hubspot/ui-extensions/crm` .

Component	Description
CrmAssociationPivot	A list of records associated with the currently displaying record, organized by their association label.
CrmAssociationPropertyList	An editable list of CRM properties belonging to a record associated with the currently displaying record.
CrmAssociationStageTracker	A lifecycle or pipeline stage progress bar that displays data from associated records. Can include a list of properties which can be edited inline.
CrmAssociationTable	A table of records associated with the currently displaying record.
CrmDataHighlight	A list of CRM properties belonging to the currently displaying record or another specified record.
CrmPropertyList	An editable list of CRM properties belonging to the currently displaying record or another specified record.

HubSpot Developers

CrmStageTracker	A lifecycle or pipeline stage progress bar with a list of properties.
CrmStatistics	Display summaries of data calculated from the currently displaying record's associations. For example, the average revenue across a contact's associated companies.

CRM action components

CRM action components provide a built-in set of CRM-related actions, including adding notes to records, opening a one-to-one email composition window, creating new records, and more. Each component can perform the same set of actions, so which component to choose will depend on your needs and preferences. Learn more about **CRM action components**.

CRM action components are imported from `@hubspot/ui-extensions/crm` .

Component	Description
CrmActionButton	A button that can execute a built-in set of CRM actions.
CrmActionLink	A clickable link that can execute a built-in set of CRM actions.
CrmCardActions	Smaller standalone or dropdown menu buttons that can contain multiple CRM actions.
