Understand updated app installation flow with the option for partner sign in

Review the updated installation flow of apps with and without partner sign in features turned on.

After April 5, 2026, all apps listed on the HubSpot Marketplace that wish to make changes to the app listing will be required to use an updated installation flow that includes an option to authenticate using **OAuth** without a separate partner sign in. You can choose to opt your app into this updated flow early, but once you do so, that app will be required to use the updated flow moving forward.

In the updated flow, if installing your app requires the user to log in to an account in your system, it's recommended to authenticate with partner sign in. If you don't need the user to authenticate beyond using OAuth, you can authenticate without partner sign in.

Understand limits and considerations

The updated install flow only applies to:

- Apps that have opted into using the updated install flow early. After April 5, 2026, it will apply to all apps that make changes in the listing editor.
- Apps listed on the HubSpot Marketplace.
- Customers installing the app for the first time. Existing customers who have already installed the app are not affected.
- Installs initiated from the HubSpot Marketplace. Installs initiated from external websites or the app itself are not affected.
- The option of whether customers need to sign in with an external system to authenticate. OAuth authentication itself is not affected.

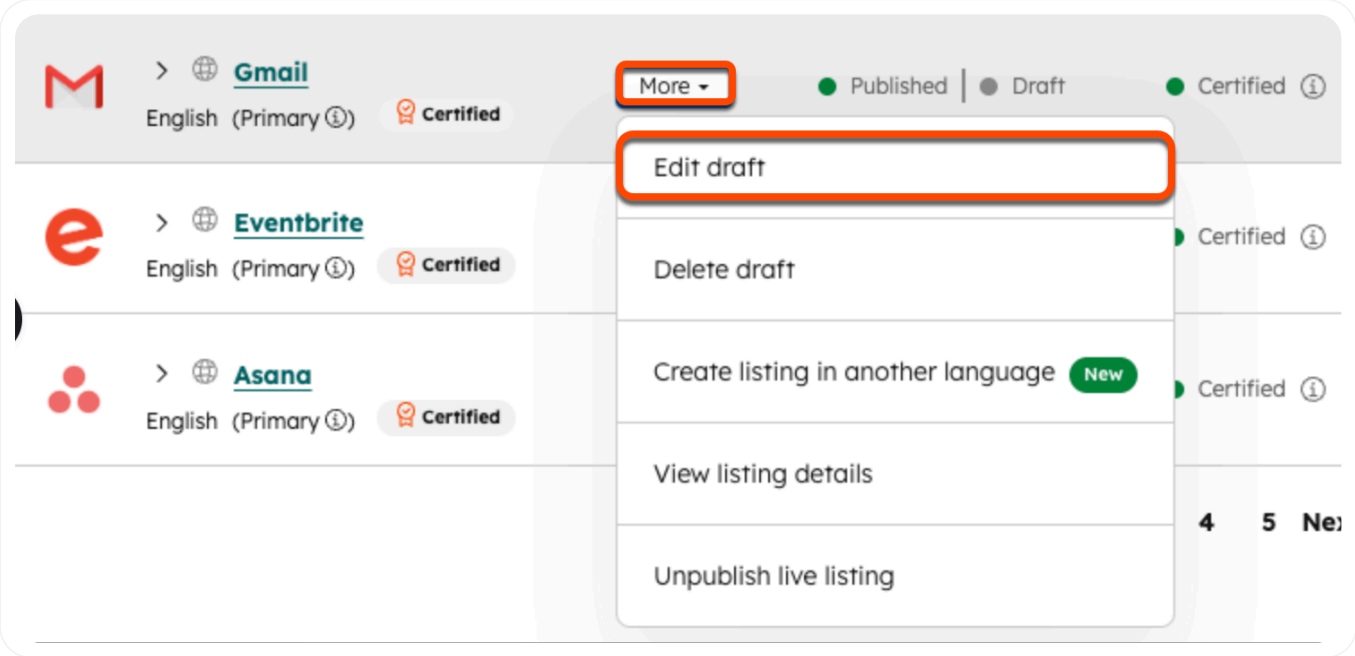
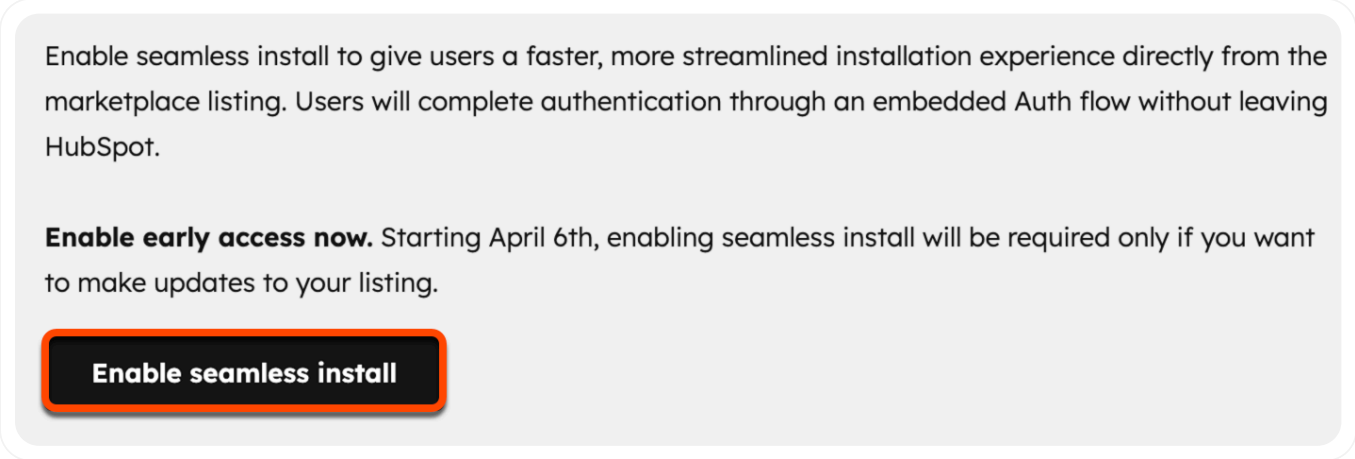
›

You can choose to switch to the updated install flow from the listing editor. Once in the new flow, you can specify a redirect URL and whether the app will require partner sign in.

1. If you are using **development tools in a standard HubSpot account**, navigate to **Development**. In the left sidebar menu, click **App Listings**.
2. If you are using a **legacy developer account**, navigate to **Marketplace** > **App Listings**.
3. Hover over an app, then click the **More** dropdown menu and select **Edit draft**.



4. In the *Listing info* section, click **Enable seamless install flow**.



HubSpot Developers

7. In the *Sign-in configuration* section, select whether the app will include partner sign in.

Developer perspective

1 Receive installation request

Your install URL endpoint receives a request with these parameters:

`code` : authorization code for completing the installation.

`returnUrl` : URL used to direct the user back to HubSpot after installation completes. The `returnUrl` will be added as a query parameter to the end of the Redirect URL selected in the listing editor when HubSpot redirects the customer there.

`step` : always set to `finalize` . You do not need to do anything with this parameter.

2 Complete installation

HubSpot Developers

```
// Helper function
function getQueryParam(param) {
    const params = new URLSearchParams(window.location.search);
    return params.get(param);
}

const code = getQueryParam('code');
const returnUrl = getQueryParam('returnUrl');
```

Use the provided `code` to .

Store any necessary configuration data associated with the user's HubSpot account.

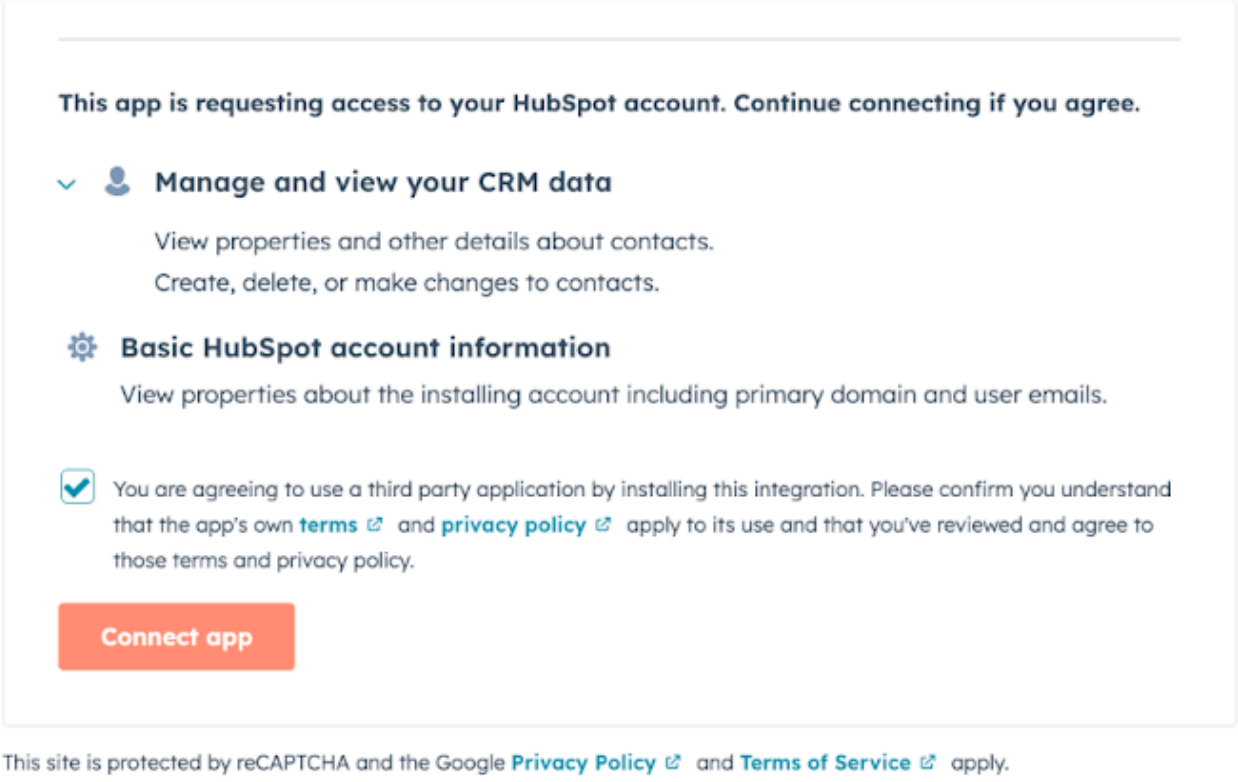
3 **Redirect back to HubSpot**

Redirect the user back to the `returnUrl` provided in the installation request. Redirecting back to HubSpot is required to avoid an infinite login loop.

Customer perspective

1. In your HubSpot account, click the **marketplace icon** in the top navigation bar, then select **HubSpot Marketplace**.
2. Click an **app card**.
3. In the top left, click **Install**.
4. In the dialog box, review the app's requirements, then select the **checkbox** and click **Connect app**.

HubSpot Developers



5. Once the app is installed, you can start using the app:

   Click **Explore app features** to start from the Feature Discovery section of the app overview page in your Connected Apps settings.

   Click **Customize app cards** to start customizing the app's **app cards**.

   Click the **X** in the top right to return to the app listing page.

Developer perspective

1. Receive initial installation request

   Your install URL endpoint receives a request with these parameters:

   - `step=authorize` : indication that this is the initial step in the installation process.
   - `returnUrl` : URL used to direct the user back to HubSpot after the authentication process completes. The `returnUrl` will be added as a query parameter to the end of the Redirect URL selected in the listing editor when we redirect the customer there.

   Example URL:

Get the `step` and `returnUrl` from the URL parameters, then show a login form or page to authenticate the user.

```
// Helper function
function getQueryParam(param) {
    const params = new URLSearchParams(window.location.search);
    return params.get(param);
}
const step = getQueryParam('step');
const returnUrl = getQueryParam('returnUrl');
```

3 Generate security token

Once the user has authenticated, you should:

Generate a cryptographically secure, randomized token unique to this user. This is the `state` token used in future steps.

For example:

```
function generateStateParameter() {
    const array = new Uint8Array(32);
    crypto.getRandomValues(array);
    return Array.from(array, byte => byte.toString(16).padStart(2, '0')).
}
const state = generateStateParameter();
```

4 Save the `state` token and associate it with the user

One option is to create a data table without RLS that stores the user's `uid` from your system and the `state` token.

HubSpot Developers

›

5 Redirect back to HubSpot

Add the `state` token you generated in the previous step to the `returnUrl` as a query parameter, then redirect the user back to HubSpot. The redirect will look like this: `${returnUrl}?state=${state}` . Redirecting back to HubSpot is necessary to avoid an infinite login loop.

For example:

```
const returnUrlObj = new URL(returnUrl);
returnUrlObj.searchParams.set('state', state);
// Redirect back to HubSpot
window.location.href = returnUrlObj.toString();
// e.g. returnUrlObj.toString() = "https://www.hubspotReturnUrl.com?state
// or returnUrlObj.toString() = "https://www.hubspotReturnUrl.com?someHub
```

6 Receive final installation request

Your install URL endpoint receives a request with these parameters:

`step=finalize` : indication that this is the final step in the installation process.

`code` : the OAuth code HubSpot uses to generate your tokens.

`state` : the secure token you generated in Step 3.

`returnUrl` : URL used to direct the user back to HubSpot after the authentication process completes.

For example:

```
https://www.myinstallserver.com/install?code=123&state
```

```
// Helper function
function getQueryParam(param) {
  const params = new URLSearchParams(window.location.search);
  return params.get(param);
}

const step = getQueryParam('step');
const code = getQueryParam('code');
const state = getQueryParam('state');
const returnUrl = getQueryParam('returnUrl');
```

8 Retrieve the user account associated with the `state` token

Validate that the `state` token matches the original authentication request.

Retrieve the associated user account.

9 Finish the process

If you are able to verify the `state` token, complete the installation:

Exchange the `code` for **OAuth access and refresh tokens**.

Redirect the customer to the `returnUrl`. Without this step, the user will be stuck in an infinite login loop.

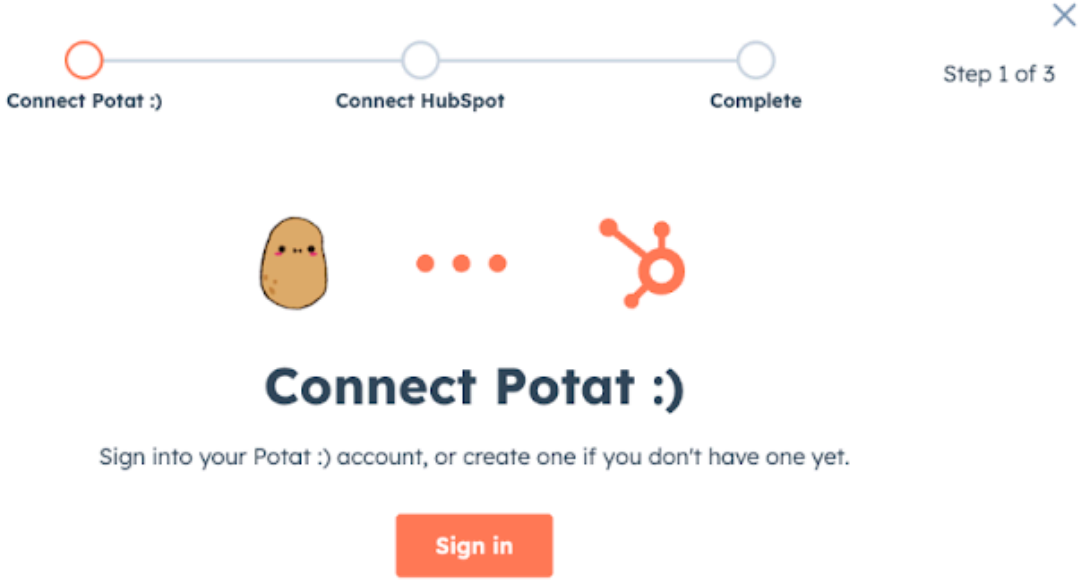
If you are not able to verify the `state` token, do not complete the installation.

Redirect the customer to the `returnUrl`. Without this step, the user will be stuck in an infinite login loop.

Customer perspective

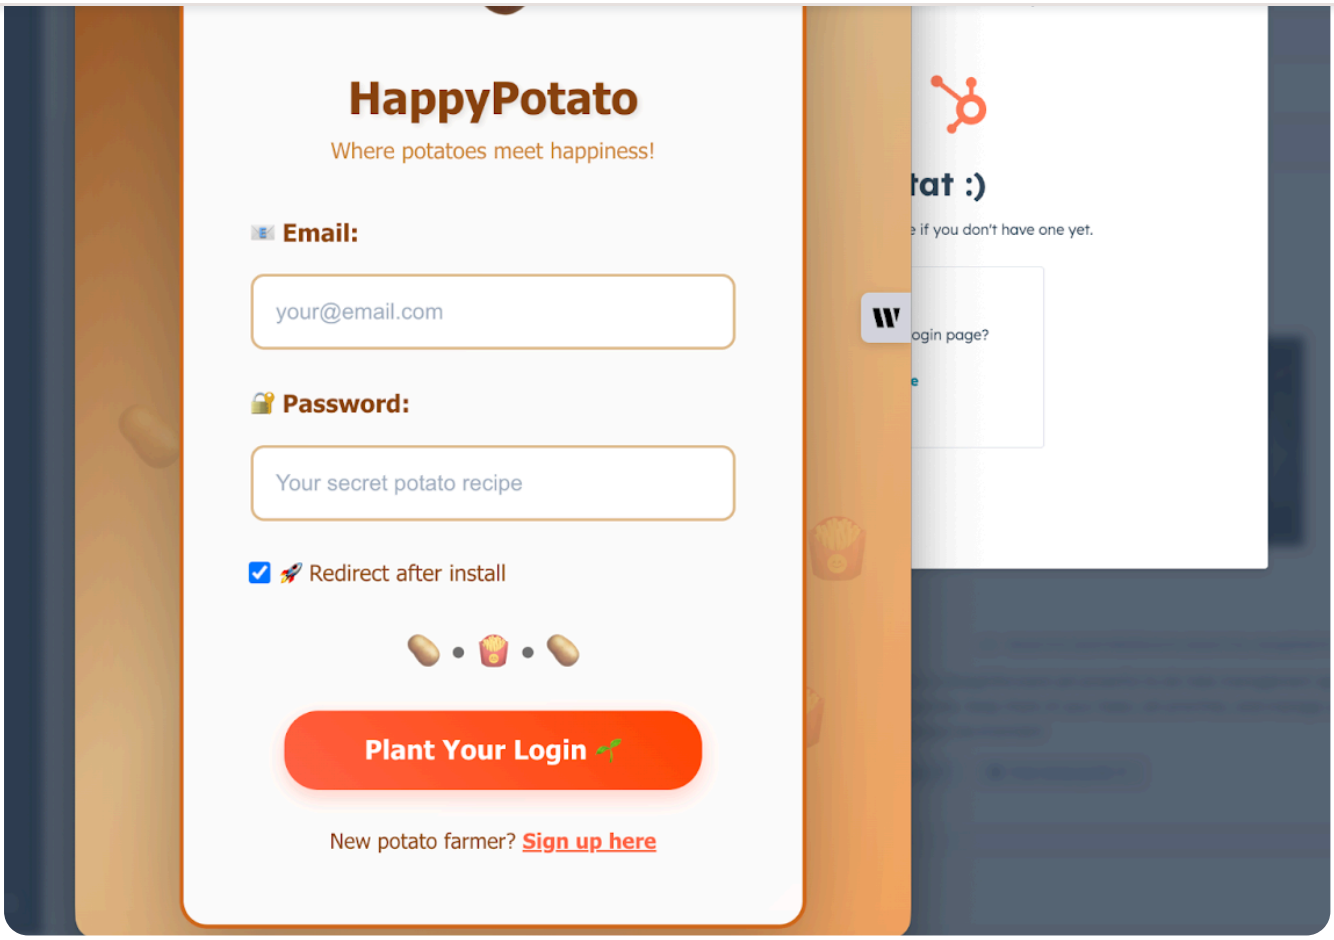
1. In your HubSpot account, click the **marketplace icon** in the top navigation bar, then select **HubSpot Marketplace**.

HubSpot Developers



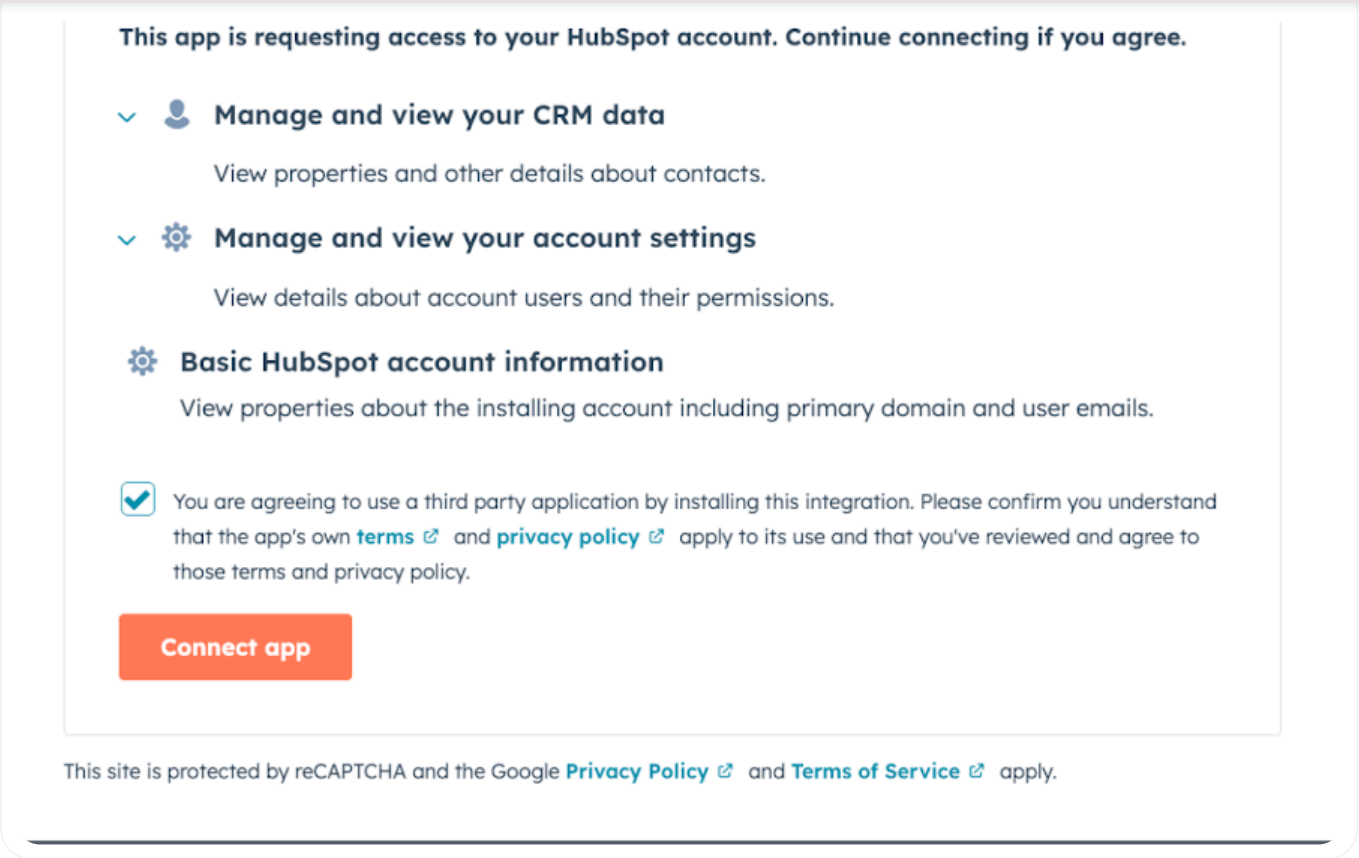
5. In the new window, finish the app's sign up / log in process externally.

HubSpot Developers



6. After being redirected back to HubSpot, review the app's requirements, then select the **checkbox** and click **Connect app**.

HubSpot Developers



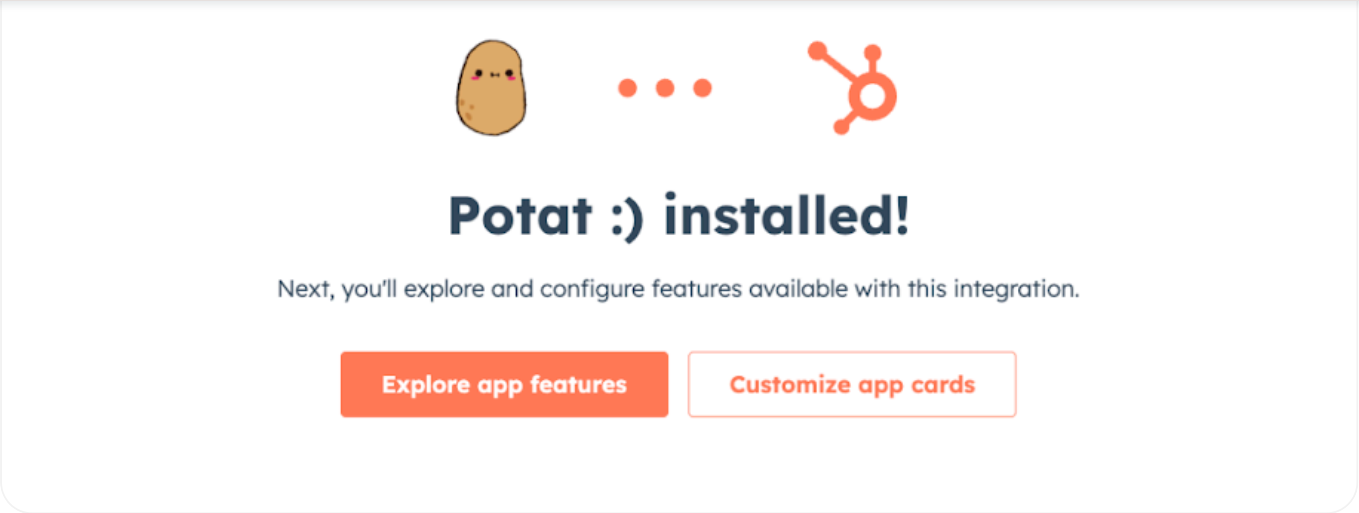
7. Once the app is installed, you can start using the app:

   Click **Explore app features** to start from the Feature Discovery section of the app overview page in your *Connected Apps* settings.

   Click **Customize app cards** to start customizing the app's **app cards**.

   Click the **X** in the top right to return the app listing page.

HubSpot Developers



Preview the install flow

Once you have opted into using the new install flow, you can test the installation process from the listing editor before publishing your changes:

1. If you're using **development tools in a standard HubSpot account**, navigate to **Development**. In the left sidebar menu, click **App Listings**.
2. If you're using a **legacy developer account**, navigate to **Marketplace** > **App Listings**.
3. Hover over an app, then click the **More** dropdown menu and select **Edit draft**.
4. In the top right, click **Preview**.
5. Run through a test version of the installation process.

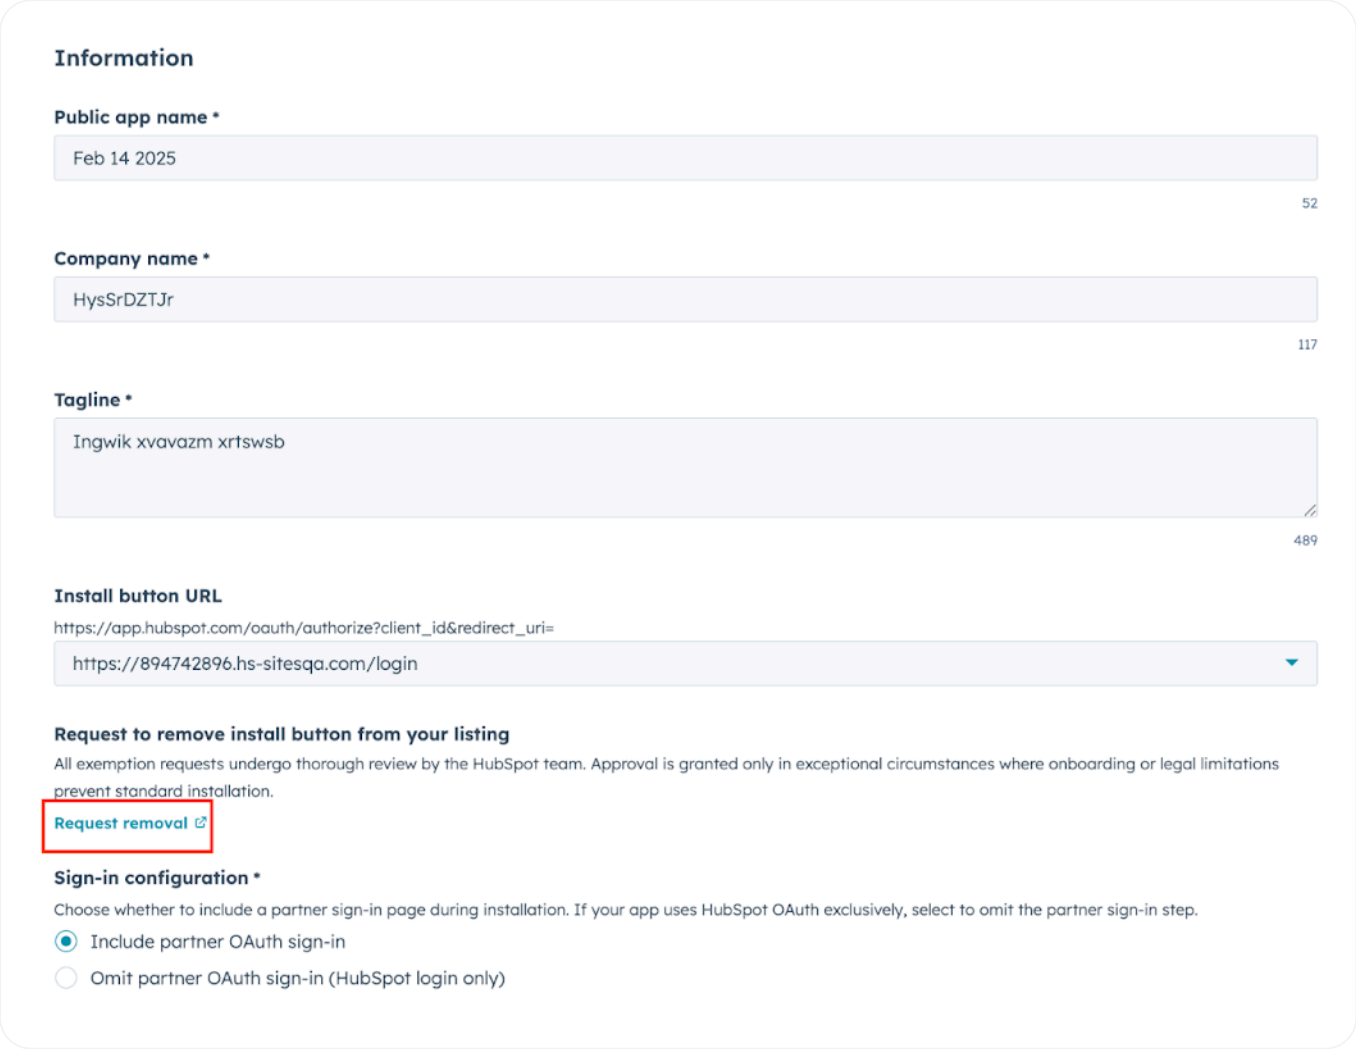
Request an exemption

If you need to update your app listing but your app cannot support self-service installation due to complex technical onboarding or specific legal constraints, you can file an exemption request. These requests are reviewed individually by HubSpot's Eco Quality team, typically within 7-10 business days.

If the request is approved, this would allow your app to replace the mandatory *Install App* button with an option to contact you or book a meeting. If the request is denied, the app will have to use the *Install App* button required by the new install flow.

HubSpot Developers

3. If you are using a legacy developer account, navigate to **Marketplace > App Listings**.
4. Hover over an app, then click the **More** dropdown menu and select **Edit draft**.
5. In the listing editor, click **Request removal** in the *Request to remove install button from your listing* section.



6. In the exemption request form, enter your name, email address, and company name, then click **Next**.
7. Enter your **Production app ID**.
8. Select an **app listing status**:

   Listed: your app listing is live on the *HubSpot Marketplace*.

   Draft: your app listing has been drafted, but isn't yet live.

the best chance of your request being approved.

12. Enter any questions or additional details you want to provide.
13. If you want to receive communications from HubSpot about products and services, select the **I agree to receive other communications** checkbox.
14. Select the **checkbox** to consent to your personal data being processed. This is a requirement for submitting an exemption request.
15. Submit the form.
