Agent tool listing requirements

Review the HubSpot Marketplace requirements for listing an app that includes agent tools.

Below, learn about the additional requirements for listing an app with agent tools on the HubSpot Marketplace, as well as how to **submit it for approval**.

Listing requirements

All apps built for the HubSpot Marketplace are subject to the **listing requirements for apps**, and certified apps are subject to the additional **certification requirements**. If you're adding an agent tool to an app intended for or already listed on the HubSpot Marketplace, you'll need to adhere to some additional criteria.

Security & Privacy

Scopes: if an agent tool accepts a HubSpot object's property values or metadata as inputs, the corresponding `.read` scope must be added to your **app's required scopes configuration**. For example, if a tool accepts deal data, the app must require the `crm.objects.deals.read` scope.

Inputs: tools must only collect inputs and context that are necessary for their outputs. For example:

> A "Summarize contact" tool may consider inputs like contact properties and data from associated meetings and tasks.
>
> A "Create quote" tool should not require context on a contact's meeting history.

LLM-specific vulnerabilities: your app will be assessed for security best practices related to LLM-specific risks (e.g. indirect prompt injection or jailbreaks).

Sensitive data: at this time, your app must not access, request, or use **sensitive data scopes**.

For example:

Acceptable: “Summarize contact” or “Create quote” tools

Unacceptable: “Social scoring,” “Employment decision,” or “Parental leave predictor” tools

Reliability & Performance

Tool type: `toolType` should match the descriptions in the **agent tool reference documentation**:

- `GET_DATA` : retrieves information from HubSpot or external sources.
- `GENERATE` : generates content, summaries, analyses, or suggestions based on the provided inputs.
- `TAKE_ACTION` : performs CRM actions, such as creating notes or assigning tasks to owners.

LLM description: `llmConfig.actionDescription` should follow the **description best practices**.

Outputs: your tools must return the outputs specified in their configurations. For example, if your tool’s `outputFields` array includes a `success_message` of `"type": "string"` , the tool should return that property in the expected format with every run.

Performance matches descriptions: your tools must perform operations successfully and as described in its `actionDescription` , `llmConfig.actionDescription` , and input and output descriptions.

Testing video: you must provide a short video demoing successful agent runs using your tools (see the **Submitting your tools for approval** section below).

HubSpot testing: your tools must pass any user acceptance tests the HubSpot Ecosystem Quality team performs.

Usability

Organization names: tool names may cite the external platform they interact with. However, they should not include an attribution to your organization in the tool name. Instead, you may use the tool description. Labeling and association will be handled by the HubSpot UI. For example:

- **Acceptable:** "Send Slack notification" or "Create Acme quote"
- **Unacceptable:** "Send Slack notification by Alpha Co." or "Create Acme quote by Omega Inc"

Tool names should:

- Begin with a verb (e.g. "Create...")
- Start with a capital letter
- Be between 3-7 words

Tool names should not include:

- Capitalized words except for the first word, proper nouns, and acronyms
- Underscores or camel case
- Jargon or hyperbole
- Generic terminology (e.g. "Process data")
- Specific agent names or use cases

Tool descriptions should:

- Be between 50-150 characters
- Provide more detail than the name
- Be written in present tense
- Be clear about whether the tool generates a generic output or something specific in HubSpot (e.g., "This tool generates text for a landing page" or "This tool creates a HubSpot landing page draft")

Inputs: every tool input should have a label and description. Each description should:

- Relate to the input's label

Value

At this time, tools should empower front office use cases (e.g., marketing, sales, and customer service). For example:

Acceptable: “Create Xero invoice” and “Send Omega gift” tools

Unacceptable: a “New hire HubSpot setup” tool

Submitting your tools for approval

To submit your tools for approval, fill out **this form** with the information below:

Production app ID: identify the app ID you intend to update or list on the HubSpot Marketplace.

App ID and build for review:

Recommended: identify your production app ID and the latest successful build with agent tools.

If your app is already listed on the HubSpot Marketplace, this build will have failed to deploy.

Alternative: identify your staging app ID and latest deployed build.

Tool UIDs for review: list the `uid` values for all agent tools.

Testing video: record a short video describing the user acceptance tests you completed with this tool build. The demo video must meet the following requirements:

Be at least three minutes long

Include audio (preferred) or text descriptions

Include descriptions of the tool(s) and common use cases

Show the test runs you completed

Recommended: if submitting your production app ID for review, this must be recorded while **developing locally**.

HubSpot Developers

Once approved, you will be able to deploy agent tools to your specified production app. You may then wish to **update your app listing** to reflect the new feature.
