CRM data components

CrmAssociationPropertyList

Learn about the CrmAssociationPropertyList component for use in UI extensions.

The `CrmAssociationPropertyList` component renders a list of properties belonging to a record associated with the currently displaying record. For example, you can use this component to display properties of a company record from its associated contact record. You can edit these property values inline, and changes will automatically save when leaving the field or pressing Enter.

›

```
    <CrmAssociationPropertyList
      objectTypeId="0-2"
      properties={["name", "domain", "city", "state"]}
      filters={[
        {
          operator: "EQ",
          property: "domain",
          value: "meowmix.com",
        },
      ]}
    />
  );
};
```

Props

Prop	Type	Description
`associationLabels`	Array	When provided, returns associated records that have all the specified labels.
`filters`	Array	Filters the data by specific values of the associated records. Review the for more information.
`objectTypeId`	String	The numeric ID of the type of associated object to display (e.g., `0-1` for contacts). See of object IDs.
`properties`	Array	The list of properties to display from the associated record, up to 24.
`sort`	Array	The default sorting behavior for the table. In each sort object in the array, you'll specify the following: `columnName` : the column to sort by. `direction` : the direction to sort by. Can be either `1` (ascending) or `-1` (descending). By default, order is ascending.
