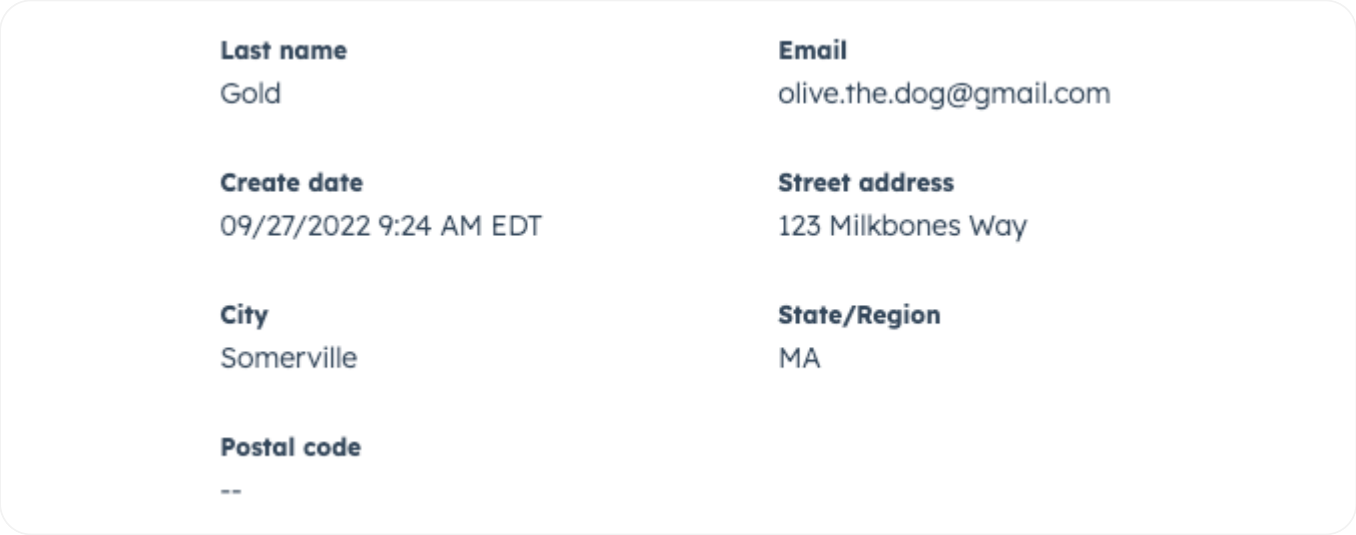
CRM data components

CrmPropertyList

Learn about the CrmPropertyList component for use in UI extensions.

The `CrmPropertyList` component renders a list of properties along with their values. You can use this component to surface important property data from either the currently displaying record or another specified record. You can edit these property values inline and will automatically save when leaving the field or pressing Enter.



```
import { CrmPropertyList } from "@hubspot/ui-extensions/crm

const Extension = () => {
  return (
    <CrmPropertyList
      properties={["lastname", "email", "createdate", "address", "city", "state
      direction="row"
    />
  );
};
```

Props

HubSpot Developers

`objectId`	String	The ID of the CRM record to display property data from.
`objectTypeId`	String	The numeric ID of the type of associated object to display (e.g., `0-1` for contacts). See **complete list** of object IDs.
`properties`	Array	The properties to display, up to 24. By default, will display property data from the currently displaying record. To pull data from a specific record, include the `objectTypeId` and `objectId` props.
