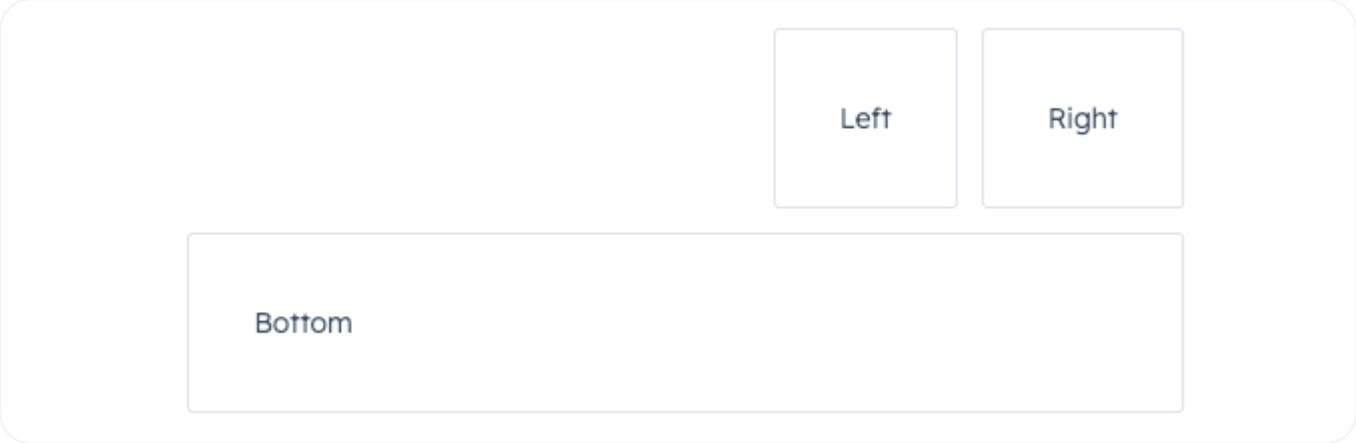
Standard components

Flex

Learn about the Flex component for configuring UI extension layout.

The `Flex` component renders an empty `div` container set to `display=flex`. When wrapped around other components, it enables those child components to be arranged using props. `Flex` can contain other `Flex` or `Box` components.

To see an example of how `Flex` and `Box` can be used for layout, check out HubSpot's **Manage layouts: Flex and Box sample project**.



```
import { Flex, Tile } from "@hubspot/ui-extensions";
const Extension = () => {
  return (
    <Flex direction={"row"} justify={"end"} wrap={"wrap"} gap={"small"}>
      <Tile>Left</Tile>
      <Tile>Right</Tile>
      <Flex direction={"column"}>
        <Tile>Bottom</Tile>
      </Flex>
    </Flex>
  );
};
```

	`"end"` | `"start"` | `"stretch"` **Default:** `"stretch"`	axis using the available free space.
`alignSelf`	`"baseline"` | `"center"` | `"end"` | `"start"` | `"stretch"`	Distributes a child component along the cross-axis using the available free space. Use this prop for nested `Flex` and `Box` components to align them differently from other child components in the `Flex` group.
`children`	`ReactNode`	Sets the content that will render inside the component. This prop is passed implicitly by providing sub-components.
`direction`	`"column"` | `"row"` **Default:** `"row"`	Arranges the components horizontally or vertically by setting the main axis.
`gap`	`"extra-large"` | `"extra-small"` | `"flush"` | `"large"` | `"lg"` | `"md"` | `"medium"` | `"sm"` | `"small"` | `"xl"` | `"xs"` **Default:** `"flush"`	Sets the spacing between components.
`justify`	`"around"` | `"between"` | `"center"` | `"end"` | `"start"` **Default:** `"start"`	Distributes components along the main axis using the available free space.
`testId`	`string`	Used by `findByTestId()` to locate this component in tests. **See: Testing utilities reference**
`wrap`	`"nowrap"` | `"wrap"` | `false` | `true` **Default:** `"nowrap"`	Whether components will wrap rather than trying to fit on one line.

Usage examples

Horizontal layout

HubSpot Developers

```
justify={'between'}
```

```
justify={'around'}
```

```
justify={'start'}
```

```
justify={'center'}
```

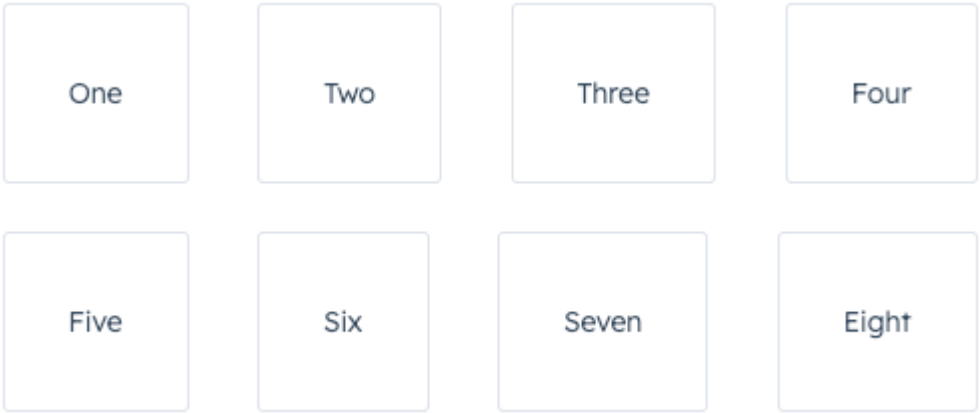
HubSpot Developers

›

```
justify={'end'}
```

Wrap

By default, components in a `row` will be arranged on one line when possible. Use the `wrap` prop to wrap components onto new lines when needed.

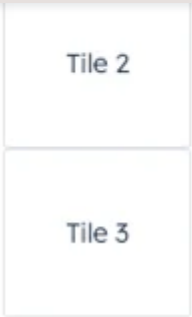


```
<Flex direction={"row"} justify={"between"} wrap={"wrap"} g
  <Tile>One</Tile>
  <Tile>Two</Tile>
  <Tile>Three</Tile>
  <Tile>Four</Tile>
  <Tile>Five</Tile>
  <Tile>Six</Tile>
  <Tile>Seven</Tile>
  <Tile>Eight</Tile>
</Flex>;
```

Vertical layout

To arrange components vertically, set direction to `column`, then use the `align` prop to distribute them. By default, components will stretch across the extension container width when `align` is not specified.

HubSpot Developers



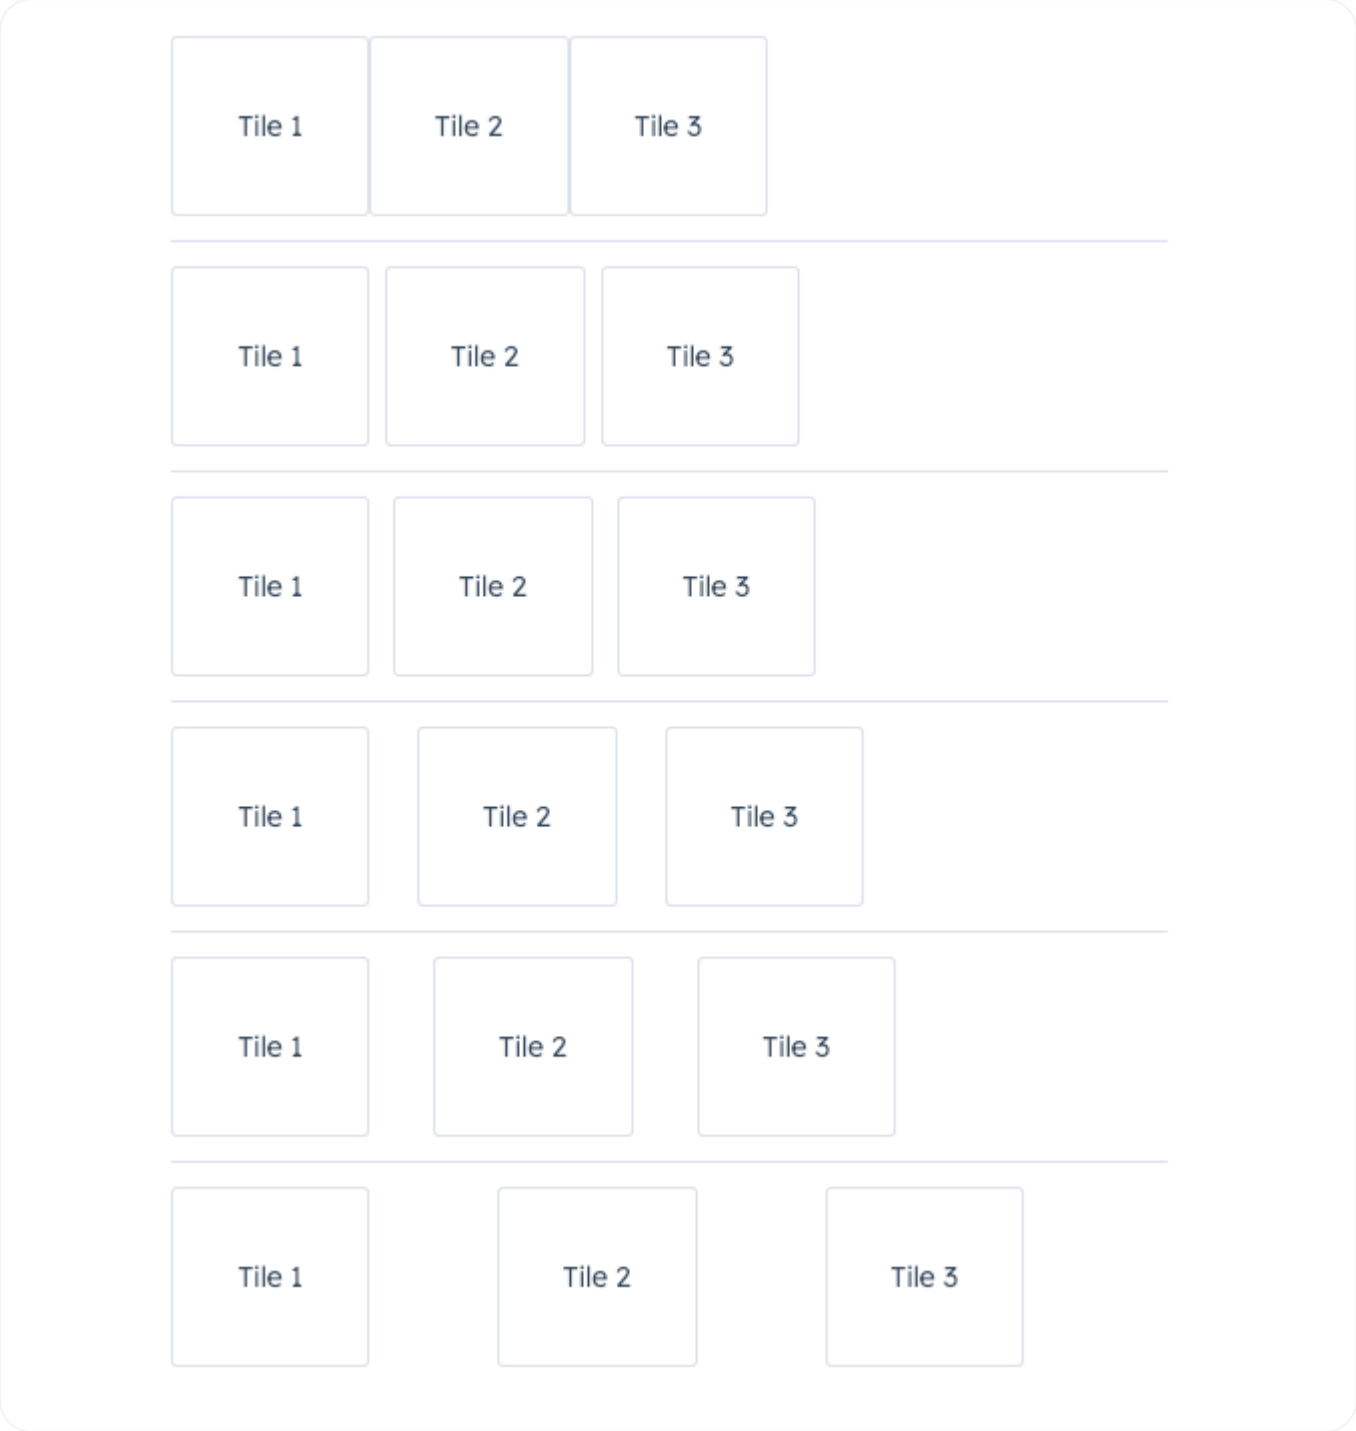
```
align={'start'}
```

```
align={'center'}
```

HubSpot Developers

›

In the `Flex` component, you can use the `gap` prop to apply even spacing between the tiles. This prop will apply spacing equally for both `row` and `column` directions.

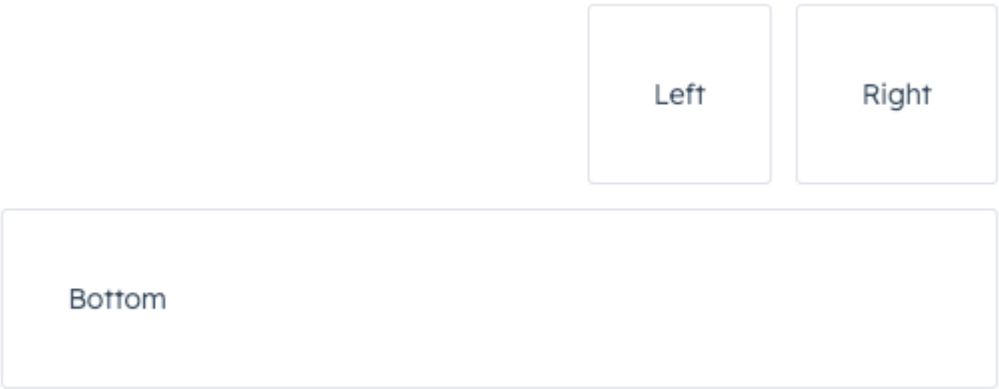


HubSpot Developers

```
</Flex>;
```

Using Flex in Flex

You can wrap child `Flex` components with `Flex` to set more specific rules for individual components. A child `Flex` component will not inherit props specified in the parent `Flex` component, so you'll need to repeat any props you've previously defined to maintain them.



```
<Flex direction={"row"} justify={"end"} wrap={"wrap"} gap={
  <Tile>Left</Tile>
  <Tile>Right</Tile>
  <Flex direction={"column"}>
    <Tile>Bottom</Tile>
  </Flex>
</Flex>;
```
